This programming project is due on **Thursday, July 14, 2022** at 10:00 p.m. The best approach is to plan to have the solution submitted BEFORE the due date. Then, if you experience any last-minute difficulty, you will still meet the deadline.

Due date: July 14, 2022

Be sure that you read and understand this entire document before you begin writing your code. Pay close attention to the **Project Deliverables** and **Grading Criteria** sections of this document. If you have **questions**, please ask during class or send me an e-mail at my BHCC e-mail address (pmorgan@bhcc.edu).

### **Overview:**

Your task is to write a program that performs two data processing tasks:

- 1. Read a text document (a file containing ASCII text) and perform the following:
  - Convert that text into a sequence of packed **unsigned integers.** (Each **unsigned int** contains the bits from 4 characters.)
  - Write the **unsigned int** values to another text file, as hexadecimal numbers, with one number on each line of the output file.
- 2. Read the **unsigned int** (hexadecimal) values and convert those numbers into a text file that matches the original text document.

## **Important Observation:**

All of the concepts necessary to produce a solution for this assignment have been covered in class. If you need help to understand this assignment, ask the instructor.

# **Implementation Details:**

The program must be a "command-loop" program (as discussed in class). The commands supported by this command-loop program must be:

- **p** Pack a text document into unsigned integers.
- Unpack unsigned integers to text
- **h** Output "help" text
- **q** Exit the program.

(continued on the next page)

Due date: July 14, 2022

### The "p" command:

The "p" command (pack) must perform the following steps:

- Issue prompts to the user, asking them to enter the name of the **input file**, and the **output file**.
- Read one complete line of text from the input text file, saving the text in a **string** object.
- Append a new-line character ("\n") to the end of the input text.
- Read characters from the string object, and use bitwise operations to pack four characters from the string object into an unsigned int variable, so that the bits of each character are positioned (in the unsigned int variable) as shown in the diagram below:

| bits 24-31  | bits 16-23   | bits 8-15    | bits 0-7     |
|-------------|--------------|--------------|--------------|
| character 1 | character 2  | character 3  | character 4  |
| character 5 | character 6  | character 7  | character 8  |
| character 9 | character 10 | character 11 | character 12 |
| •••         |              |              | •••          |

- Write the **unsigned int** variable to the output file, using an object of the **ofstream** class.
- Repeat the packing and output operations for each group of 4 characters from the original document.
- If there are any characters "left over" from the last group of four characters, then the final (partially full) **unsigned int** value must be written to the output file.

### The "u" command:

The "u" command (unpack) must perform the following steps:

- Issue prompts to the user, asking them to enter the name of the **input file**, and the **output file**.
- Read one **unsigned int** value from the input file, extract four ASCII characters from the **unsigned int** value, and output the four ASCII characters to the output file.
- Repeat the unpacking operation for each **unsigned int** number: extract 4 characters and copy them to the output file.

This process of unpacking characters from the integer values, and then writing those characters to a text file accomplishes the **reverse** of what the "**p**" command did.

(Refer also to the **Sample Output** section of this document.)

### Format of the Source Code:

The format of the source file must look something like the following example:

```
Format of the source code
//
               CSC237 Project2: Text Packing / Unpacking Operations
//
               yourName
    Student:
// Due Date: projectDueDate
//
   Description:
     This program reads a text document, "packs" the ASCII characters
//
       from that document into unsigned int variables, and outputs those variables
//
//
       to another text file, formatted as hexadecimal numbers.
//
       This program also reverses the process, converting the unsigned int numbers
//
      back into a copy of the original text document.
#include <iostream>
using namespace std;
int main()
```

### **Sample Output:**

Test your program with different input values. The samples that follow show correct output for several test cases. (In these examples, the text that the user types is shown in **BOLD** font. The <u>actual</u> input / output will all be displayed in the same font.)

```
Sample Input / Output: Example 1
Command: h
Supported commands:
        Build Packed Data File.
    u Create unpacked (text) data from packed data.
    h Print this help text.
    q Quit (exit) the program.
         Set or Clear verboseMode (debug aid).
Command: p
Enter the input filename: alphabet.txt
Enter the output filename: alphabet PACKED.txt
Input text (length=26): ABCDEFGHIJKLMNOPQRSTUVWXYZ
Command: u
Enter the input filename: alphabet PACKED.txt
Enter the output filename: alphabet UNPACKED.txt
Command: q
Are you sure that you want to exit the program? Y
Exit the program.
```

Input File: alphabet.txt

ABCDEFGHIJKLMNOPQRSTUVWXYZ

Due date: July 14, 2022

|          | Output File: | alphabet | _PACKED.txt |
|----------|--------------|----------|-------------|
| 41424344 |              |          |             |
| 45464748 |              |          |             |
| 494A4B4C |              |          |             |
| 4D4E4F50 |              |          |             |
| 51525354 |              |          |             |
| 55565758 |              |          |             |
| 595A0A00 |              |          |             |

# Output File: alphabet\_UNPACKED.txt ABCDEFGHIJKLMNOPQRSTUVWXYZ

In addition to testing your program with a small text file, you must also test your program with a larger (multiline) text file:

# Sample Input / Output: Example 2 Command: p Enter the input filename: preamble.txt Enter the output filename: preamble PACKED.txt Input text (length=75): We the People of the United States, in Order to form a more perfect Union, Input text (length=80): establish Justice, insure domestic Tranquility, provide for the common defense, Input text (length=78): promote the general Welfare, and secure the Blessings of Liberty to ourselves Input text (length=65): and our Posterity, do ordain and establish this Constitution for Input text (length=29): the United States of America. Command: **u** Enter the input filename: preamble PACKED.txt Enter the output filename: preamble UNPACKED.txt Command:

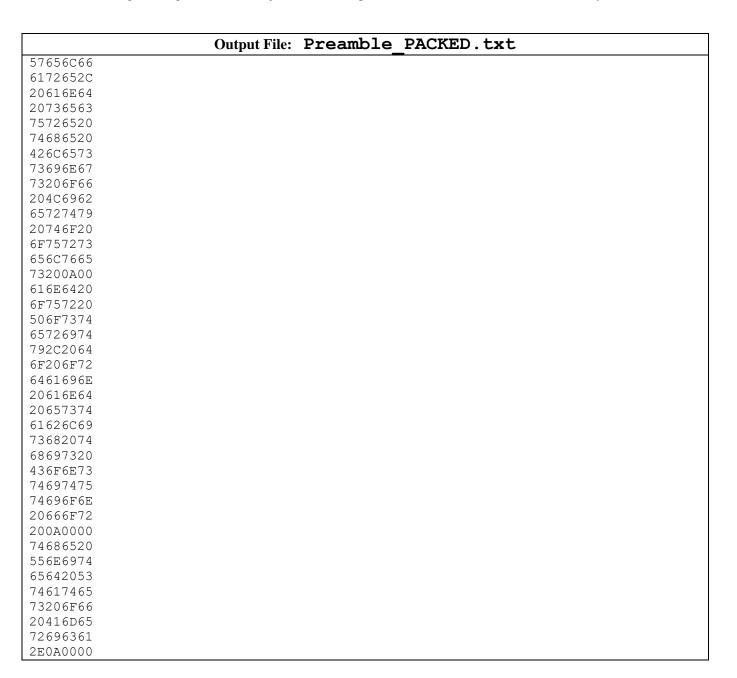

### Input File: Preamble.txt

Due date: July 14, 2022

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defense, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

|          | Output File: | Preamble | PACKED. | txt |  |

Due date: July 14, 2022

### Output File: Preamble\_UNPACKED.txt

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defense, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

## **Project Deliverables:**

The project source file must be submitted to *Moodle*, using the *Moodle* assignment for this project.

Submit *only* your source code (\*.cpp) file. I will need to compile your code on my home computer in order to grade it.

- Do *not* submit the entire project from your preferred IDE.
- Do *not* include any project folders, or any binary files.
- Do *not* place the source code file in a "ZIP" file, a "RAR" file, or any other file collection.

# **Grading Criteria:**

The project will be graded according to the following grading criteria:

|    | Feature  | Portion of grade |
|----|--|------------------|
| 1. | The program functions correctly.   | 50%              |
| 2. | The program <b>must</b> be organized as a "command-loop" program. (We              | 10%              |
|    | discussed the "command-loop" design in class.)                                     |                  |
| 3. | In the <b>main</b> function of the program, there is a loop that contains code to  | 10%              |
|    | support the following input commands:  |                  |
|    | p Build Packed Data File.  |                  |
|    | u Create unpacked (text) data from packed data.                                    |                  |
|    | h Print help text.   |                  |
|    | q Quit (exit) the program.   |                  |
| 4. | The "command loop" in the <b>main</b> function must continue until the user        |                  |
| ٦. | enters a 'q' command.  |                  |
|    | chers a q command.   |                  |
| 5. | The <b>main</b> function must call <u>other functions</u> to implement the various | 5%               |
|    | commands.  | 270              |
| 6. | The program must NOT contain any global variables <i>except</i> the optional       | 3%               |
|    | <b>verbose_mode</b> variable described in class. (Global constants are OK.)        |                  |
|    |  |                  |
| 7. | The program uses good, descriptive variable names.                                 | 5%               |
| 8. | The program source code is clearly organized and <b>commented</b> so as to         | 15%              |
|    | make it easy to read and understand:   |                  |
|    | • The source file must have a heading comment, similar to the                      |                  |
|    | example shown in the project assignment document.                                  |                  |
|    | The comments within the code must describe each short section of                   |                  |
|    | the program. (Do <b>not</b> place a separate comment on every line of              |                  |
|    |  |                  |
| 0  | Code.) The source code (con) file must have a descriptive name such as             | 20/              |
| 9. | The source code (.cpp) file must have a <u>descriptive</u> name such as            | 2%               |
|    | "project2.cpp" or "textPacker.cpp". Do NOT use the default                         |                  |
|    | file name (for example "Source.cpp") provided by the IDE.                          |                  |
